Book Descriptions:

We have made it easy for you to find a PDF Ebooks without any digging. And by having access to our ebooks online or by storing it on your computer, you have convenient answers with brake fault service manual passat . To get started finding brake fault service manual passat , you are right to find our website which has a comprehensive collection of manuals listed.

Our library is the biggest of these that have literally hundreds of thousands of different products represented.

Book Descriptions:

brake fault service manual passat

Yes, my password is Current2004 Passat 1.8T However my brakes work perfectly fine. It happens every so often, but lately Ive noticed it happening ALL THE TIME, and its really annoying, it happens most when I am taking a turn, so Im not sure if its some short circuit or if something near my brakes is touching something it shouldnt and setting it off, really I have no idea. I havent been able to scan it because the cable I have access to works on PC not a MAC. But if all goes to plan Ill be able to do that tomorrow, but I was trying to get any insight if I could now. Thanks, Das Auto1.8T These cars are very sensitive to that; turning causes the sensor float to dip a little. If so, top it up and very carefully watch it for a while to see if it drops again. Beyond that, get it scanned. Mine did the same thing and eventually the warning was on most the time. Get the module repaired and the common failure point fixed. I had mine repaired by cheapabs.com. Works great now.Current2004 Passat 1.8T These cars are very sensitive to that; turning causes the sensor float to dip a little. Beyond that, get it scanned. If its low, thats probably a good indication that your brakes are pretty worn and the pistons in the calipers are extended. If not, it means that youve got a leak someplace that needs to be fixed. And now, when you actually do get around to doing the brakes, and you push the pistons back into the calipers, the brake fluid reservoir will most likely overflow, dumping brake fluid into your engine bay. Have you ever seen what happens when you get brake fluid on painted itemsCurrent2004 Passat 1.8T If its low, thats probably a good indication that your brakes are pretty worn and the pistons in the calipers are extended. Have you ever seen what happens when you get brake fluid on painted items But I recently did my brakes and a caliper not to long ago, maybe have driving 810k on them.<http://adamlegal.com/userfiles/cpap-respironics-remstar-m-series-clinician-manual.xml>

I put in really so little amount of brake fluid and my fault stopped, and every time I park somewhere for awhile, when I leave I check for any spills. But youre right I shouldnt take chances, so definitely going to take it to the shop. But thanks for the info, it helped!Brakes are one of the generally simple things to work on with these cars. Monitor the potential leak for a few days to a week. If no fault warning, then you should be good as far as leaks. Check the inside of your wheels to make sure. You also may want to bleed your lines to make sure theres no air. Id also take it to Auto Zone or some place similar and have it scanned for codes. Could be ABS module going bad, but wont know yet. Several things could be at play here.Current2004 Passat 1.8T Brakes are one of the generally simple things to work on with these cars. Several things could be at play here. I have a metal belly pan and it puts whatever leaks off to the side so sometimes its difficult to tell where its coming from, but thanks for the advice, will post what it is when I find out.Current2004 Passat 1.8T But believe it or not, I put in the tiniest amount of brake fluid, and the fault has never come back on! I grabbed some DOT 4 and filled up the reservoir, but it only took a very small amount of fluid. So I fired up the car and pumped the brakes for about 10 seconds, turned it back off then checked it again and the fluid level was under the screen again. Anyway, repeated this process about 6 times and figured Id put enough in by now. I didnt see any fluid leaking anywhere but Ill have the shop look for next time I take it in. jakeDigital Point modules Sphinxbased search Content on vvwortex.com is generated by

its users. vwvortex.com is not in any way affiliated with Volkswagen AG. Next time it happens, check to see if your brake lights come on. VW are telling me it is the ABS module breaking down and the pump. On the diesels, it makes the glowplug light flash. <http://chickenwild.com/upload/contents/images/cpc-6128-user-manual.xml>

Next time it happens, check to see if your brake lights come on. Its easy! Sign in here. JSFiddle or its authors are not responsible or liable for any loss or damage of any kind during the usage of provided code. However my brakes work perfectly fine. Got this warning the other day it will start beeping then display the warning and go had worn down. I think the cold weather may also cause the fluid to contract slightly. It is virtually impossible to see the fluid level through the reservoir on the Passat though! 12 Feb 2010 Beep beep beep stop Brake fault Service manual. This dissapeared after a few seconds and has not reappeared. I have to really push it hard down. Please help. Thanks, If yes what kind Please refer to CarGurus Terms of Use. It may not display this or other websites correctly. You should upgrade or use an alternative browser. After checking my brake fluid it was full and no need to add more, no leaking or anything. So im asking the experts here do you think that is the case. Car was working fine yesterday and it just started when turning the car on today. Have someone else scan it. As for easy things to check, check all four ABS sensors and speed sensors. You can try tapping the backs of the ABS sensors and see if they seat. Is there any change in your brake pedal, mushy, further travel, etc. Edit, when checking the sensors try unplugging them and plugging them back in, may just be a bad connection. Also you can try disconnecting the battery for 15 minutes and see if that helps. But no my break pedal feels the same. That light is blinking and the STOP Brake Fault Service Manual message comes on the screen i been driving the car and it works flawless so its kinda pissing me off ive spent to much money on the car recently and ofc something else needs to appear.

Im taking it to a dealer but kind of want to know what Im in for. Also my I think check engine light came on. Are the two connected. Submitted 11 years ago. Ask Your Own VW Question Customer reply replied 11 years ago Hi David, The brake light in my RPM thing comes on when the message comes up. Does that help VW Mechanic David, VW Master Technician replied 11 years ago This may just be that the brake fluid level is low. The low fluid level could indicate that the brake pads may be worn down, which would require brake fluid to fill the piston area that is compressed. I would advise to check the level, if it is low, then have the brake pads inspected to see if they are worn down. The other issue would be a brake fluid leak, but you would feel a very soft or spongy pedal when stoping. On the master cyl is a level sensor built into the top or the resivoir depending on which model you have. The level sensor will cause the brake light to come on and display that says stop brake fault. Take a look and let me know what you find. If it is low, you could add a little brake fluid, but again if the pads are worn, the tech will need to drain some out before they compress the caliper pistons back in when replacing pads. Ask Your Own VW Question Customer reply replied 11 years ago Awww yes you are correct it did say Brake Fault. Youre good David. My last question is I rented a VW Jetta earlier this year and found that it was much easier to turn than my Passat. Does my Passat have power steering fluid or a belt. If its a belt how much do they typically cost to replace Thanks.

<http://www.raumboerse-luzern.ch/mieten/3vz-fe-manual>

VW Mechanic David, VW Master Technician replied 11 years ago The passat does infact have power steering fluid, but its probally not low as it whine very load if it was low. The newer Jetta was electronic power steering and is a much better system, it will feel much easier to move then the

older system, and the other feature is that the faster you go the firmer it will feel, this is done to prevent oversteer in an emergency move. All of the new VWs use this except the Beetle which is the older hydraulic style. The place you add power steering fluid is right behind the drivers front headlight area inside the engine compartment. You should see a grey or green cap with a slot for a screw driver to turn open David, VW Master Technician Category VW Satisfied Customers 2,366 Experience VW Master Technician Certified for 9 years, ASE Master Technician Certified Verified David and 87 other VW Specialists are ready to help you Ask your own question now Was this answer helpful. On my way home last night the light came on again, I checked the oil level and it was fine. There I have a VW Passat, 2003. There is an error message that keeps coming up and I have no idea what it means. Can you please help me. Stop Brake Fault Service Manual Thats all it ever says. My check engine light has been on for over two months. I change oil every 5000 miles, and car runs good even when this light is on. Any idea what it could be. A few days ago, the check engine and ABS light came on on the instrument panel. Dings for a couple of seconds and then goes off. While driving 50 mph, the check engine and oil lights illuminated. When the contact depressed the brake pedal, it felt as if the rear tires were locking. He took the vehicle to the dealer and they stated that there was computer chip failure with the ABS and the entire computer needed to be replaced. The powertrain was unknown. The current mileage was 83,000 and failure mileage was 82,978. I get a stop! brake fault; service manual

message which many, many others are also getting. VW should absolutely issue a recall for this as many VW dealers are seeing this exact issue which happens to be very expensive to fix and diagnose. Intermittent for first day, remained illuminated day 2 3. Dealer service indicated the ABS communication module failed; when lights are on ABS will not activate. Mechanic explained that this was common to Volkswagen cars between 50100K miles. ABS control unit failed. Web and forum searching showed this to be a very common problem with both Volkswagen and Audi. It has 94,000 miles. There are defects in the ABS and brake light warning system. I have taken the car to certified import mechanics, who stated there was absolutely nothing wrong with the brakes or brake functions. I have been investigating this problem online and have found that thousands of people were having the same problem. How are we as consumers supposed to know when to take the warning light seriously. They were charged thousand of dollars to fix this problem, and Volkswagen never fixed the problem the warning lights still popped up randomly.

Consumers pay for a feature such as ABS brakes for the safety of our children and our own safety, but this Volkswagen situation was disconcerting. It seemed like everything on the car had to be replaced. The control arms, O2 sensors, twice, belts, stereo didn't turn on, all new hoses right away, all 4 window regulators, and now to top it all off, the ABS lights kept coming on. My husband has a 2000 Audi A4, virtually the same car, and had to replace all of the same things. I looked at some online forums and found thousands of people with similar problems. The manufacturer, Bosch or Volkswagen, should do something about this. My car has been parked since August 2006 because I don't have money to fix it. I am college student. Help! Also, warning stop sign came on, and the tachometer dropped to zero. Never happened all the time, but it did get much more frequent, probably about 80% of the time these things were happening. The technician reset the code which made the beeping stop and made the light disappear temporarily. I attempted to get it fixed a few times to no avail. Upon further investigation, I became aware that this is a common problem with VW but VW of North America refused to correct this issue and consumers are being forced to pay out of pocket, which is an expensive repair. In October of last year, I filed an official complaint with the California dept of Consumer Affairs, bureau of automotive repairs bar who attempted to advocate on my behalf but were unsuccessful as well. I was told by the bar that there have been thousands of complaints registered but no action has been taken against the VW of North America yet. VW of North America needs to step up to the plate and act responsibly to correct this issue before tragedy hits. If govt entities such as NHTSA and other organization cannot force VW to act then the VW owners need to consider filing a class action law suit. This is a serious matter and I for one have already begun looking in to this option.

I am tired of dealing with vwofa and they need to be held accountable for their action. It gives warning lights and messages that its not working. The drivers manual indicated that the brakes could fail at any time. The vehicle was taken to the dealer where the fuel lines, clamps and seal were replaced. Also, while driving at various speeds, the ABS light illuminated on the dashboard. The dealer replaced the entire ABS system. Brakes are otherwise ok. Dealer said he wouldn't drive without ABS as was too dangerous. This is my 1st car with ABS and I am not convinced it is worth fixing at least at that cost. Not sure if this is not just another scam. The problem went off. The message says it is emission workshop. I have not taken it to a VW dealer, however, I suspect it is the same catalytic converter problem. Another problem I have had is the stop brake fault message. The ABS light is on while the brake light is illuminating. I have taken my car to two different independent mechanics to check on the issues. They mentioned that the brake pads were all fine. And so was the fluid brake reservoir level. They were guessing it was electrical problem or ABS sensor problem. No events leading to its failure it just shut down one day and the ABS light has been on since. Currently

waiting for a cheaper fix or possible recall. ABS control module needed replacement due to ECU defect or failure. Research shows this is a common problem and should be included in a recall. I have checked various websites and found that ABS failures on Volkswagen from this era are extremely common so common in fact that an entire industry has sprung up to rebuild the defective Bosch ABS systems in VWs and Audi. Although there was no accident or injury as a result of this failure I still received an alarming message on the dashboard to stop while in the left lane of the NJ turnpike in heavy traffic and that could have caused a serious accident.

There's absolutely no excuse for a failure like this at such low mileage to be so common. Three weeks later my ABS light and ASR light comes on and it reads in the middle of the dash to stop. The car is just too new for this type of stuff to happen there should be a recall on this because I know I'm not the only one. And just to add, my old car which I have to drive now since I don't have the money to fix the problems with the VW is a Honda Prelude with 185,000 miles and still no problems. Reload to refresh your session. Wcześniej taka informacja pojawiała się sporadycznie a teraz prawie co 3 zakret. Sprawa jest następująca, klocki są ok, tarcze również. Podłączam pod VAGa i żadnych błędów nie ma. CAR STATUS jedynie pokazuje żebym dołal płynu do spryskiwaczy ciągle się kończy ale nic na temat tej informacji o hamulcach która została wyświetlona. Od czego zacząć ktoś ma pomysł Płyn hamulcowy Czujnik poziomu Dzieje się to w moim przypadku zawyczaj gdy kończą się klocki, tarcze i tłoczki w zaciskach są już bardziej wypchnięte co powoduje że poziom płynu w zbiorniczku wyrównawczym opada i przy mocniejszym zakrecie potrafi pojawić się ten komunikat. Dolej odrobine płynu hamulcowego i komunikat przestanie się pojawiać. Nie zapomnij odessać nadmiaru gdy wymienisz klocki, lub klocki i tarcze na nowe wtedy tłoczki się wciska i poziom płynu się podnosi w zbiorniczku. Pozdrawiam. Dołanie płynu nic już nie pomogło nawet było za dużo, więc odessałem trochę strzykawką dodam, że ostatnimi czasy wymieniałem klocki. Najdziwniejsze jest to, że zauważyłem, że komunikat pojawia się tylko wtedy, kiedy mam zakrecony korek od zbiorniczka z płynem hamulcowym.

W momencie, kiedy korek odkreca komunikat się nie pokazuje odkryłem to przypadkowo, kiedy dolewając płynu na początku sprawdziłem czy komunikat zniknął zniknął więc zakreciłem korek odpalam auto, a tu komunikat się pojawił. Potem już odkrecałem i zakrecałem i właśnie była taka zależność. Co to może być? Z góry dziękuję za pomoc. Dodam, że płynu mam teraz praktycznie max. Dodam, że klocki i tarcze są ok, płynu hamulcowego jest full i na pewno nie jest to zepsuty czujnik hamulca ręcznego. Czy ktoś już odkrył co to. Płyn w normie, reszta z hamulcami też. Pozdro. Mirek U mnie dzieje się dosłownie to samo i trochę boję się jeździć. Jakis czas temu miałem niewielki wypadek, ale bezpośrednio po nim nic się nie działo. Wydaje mi się, iż problemy zaczęły się w momencie kiedy temperatura nocami spada poniżej zera. Dzisiaj np. 4 stopnie C chciałem przejechać tylko 7 km na stację benzynowa i w momencie kiedy zacząłem zwalniać przed ustap, pojawił mi się ten komunikat. Później już praktycznie na każdym ostrzejszym zakrecie. Poza tym odkrecając ten złoty plastikowy korek zakreślony czerwona petla na zdjęciu widac, było że płynu jest pełno. Ale to na marginesie. Jenak patrzeć pod zakretkę i na miarkę już nie. A to dlaczego zbiornik tak szybko się wypełnił jak dolewałem płynu za pierwszym razem. Należy czymś czystym delikatnie w niego postukać aby on spłynął głębiej. Powiedział, że bywało, iż ten czujnik w zbiorniku siadał. Jednak to wychodziło mu już na laptopie. Nawiasem on używa urządzenia, które nazywał KTS. Boscha o ile dobrze pamiętam. Komunikacja z PCtem przebiega przez bluetooth. Fajny bajer. Na szczęście błąd pojawiał się sporadycznie przez okres około 4 dni, głównie przy skręcaniu. Zniknął po dolaniu płynu hamulcowego. Pozdrawiam. Dzisiaj jadąc do pracy spostrzegłem wyżej wymieniony problem. Mechanik zapomniał dolać płynu hamulcowego po odpowietrzeniu sprzęgła i z tego powstał błąd. Dzięki za info.

Restore formatting Display as a link instead Clear editor Upload or insert images from URL. Cards Conversions I'm thinking it's possibly a broken wire in an ABS sensor or something but I thought I'd ask here to see if anyone else has ever experienced this issue. The brakes seem to work fine with out issue. Thanks, Dan Level is monitored with a float switch. Hard turns will slosh the fluid and trip the switch if it is low. Top up the fluid a bit, but don't fill it. As the pads wear, fluid will go down to fill the calipers. You don't want to fill it up with worn pads or it will overflow when you push the pistons back and install new pads. Is the ABS light on. If not, it is most likely a fault in the fluid level sensor circuit. VWoA or VWAG and is supported by contributions from viewers like you.
